

1) Take the different input from the user and print their datatypes.

```
name = input("Enter your name: ")  
age = int(input("Enter your age: "))  
salary = float(input("Enter your salary: "))
```

```
print("Datatype of name:", type(name))  
print("Datatype of age:", type(age))  
print("Datatype of salary:", type(salary))
```

Output :

Enter your name: Rahul

Enter your age: 22

Enter your salary: 25000.50

Datatype of name: <class 'str'>

Datatype of age: <class 'int'>

Datatype of salary: <class 'float'>
