

1) What is high level programming language?

A **high-level programming language** is a programming language that is **easy for humans to read, understand and write**. It hides most of the complex machine-level details, such as memory addresses and CPU instructions.

For example, Python is a high-level language:

```
a = 10
```

```
b = 20
```

```
print(a + b)
```

A high-level programming language is a language that is easy for humans to understand and write. It hides the complex hardware and machine-level details. Python, Java and C++ are examples of high-level programming languages.
